

2019 ANNUAL WATER QUALITY REPORT

ABOVE AND BEYOND

Your tap water quality is consistently monitored by the Village, by the Illinois Environmental Protection Agency (IEPA), in the CLCJAWA Water Quality Lab and by other independent labs. This aggressive water quality assurance program is thorough: bacteriological tests are conducted six times more often than required, water clarity is monitored every 10 seconds and our water is checked for over 300 hundred contaminants annually.

This is your annual water quality report for the period of January 1 through December 31, 2018. Each year the Village issues this report to provide you information about the quality of our drinking water, the source of our water, how it is treated and the regulated compounds it contains. These reports are issued in compliance with the Safe Drinking Water Act. For more detailed information about our water's quality, including test results for unregulated compounds, contact Marty Wittrock, Deputy Director of Public Works, at 847-362-3434, our website at www.libertyville.com. Melissa Olenick at CLCJAWA at 847-295-7788, email at molenick@clcjawa.com, or visit their web page at www.clcjawa.com. *Este informe contiene información muy importante sobre el agua que usted bebe. Tradúzcalo ó hable con alguien que lo entienda bien.*

CLCJAWA and the Village of Libertyville were in full compliance with all State and Federal drinking water regulations in 2018.

FROM THE SOURCE

The Village of Libertyville purchases water from the Central Lake County Joint Action Water Agency (CLCJAWA), which is an inter-governmental cooperative formed by the communities it serves. This treated Lake Michigan water enters our system through two separate delivery structures. The water system also includes three elevated storage tanks which provide pressure and two ground storage tanks for emergency use. Water pumping stations and control valves create four separate pressure zones. The Village also maintains several backup emergency wells which are operated and sampled for bacteriological quality on a monthly basis to ensure reliability if the need ever arises. Please contact us if you would like to review our well sample results.

THE TREATMENT PROCESS

Our water is pumped from Lake Michigan and treated at CLCJAWA's Paul M. Neal Water Treatment Facility in the Village of Lake Bluff. The enhanced water purification process used by CLCJAWA is unique. First, the water is treated with ozone to kill organisms and break down contaminants. Ozone is produced on-site from air, bubbled into the water and then converted back into oxygen. The water is then mixed with a coagulant to remove sediment and other material from the water. Once clarified, the water is further refined as it passes through filters containing activated carbon and fine sand to remove the remaining turbidity. Turbidity is a measure of water clarity. Treatment facilities monitor turbidity because it is a good indicator of water quality and the effectiveness of their filtration and disinfection systems. At CLCJAWA, turbidity is checked every ten seconds in numerous locations by automatic monitoring equipment and twice a day, by hand and in the laboratory (see results page 3).

Next, the water is treated with ultraviolet light to inactivate any remaining organisms. Finally, the purified water is treated with chlorine to protect it as it travels through the water main, fluoride for dental health and a small amount of an often used food additive called phosphate. Phosphate protects the water from the metals, such as lead and copper that are found in our homes' plumbing systems.

CLCJAWA received the Excellence in Water Treatment award for the last 13 years. CLCJAWA was the third facility in the nation to achieve this distinction presented by the Partnership for Safe Water. This voluntary water quality program, sponsored in part by the United States Environmental Protection Agency, holds its awardees to higher standards than required by current drinking water regulations.

DELIVERY TO YOUR TAP

CLCJAWA utilizes over 50 miles of pre-stressed concrete, ductile iron and PVC water main to deliver water to our community. Our system contains approximately 125 miles of water main in sizes ranging from 4" to 24" in diameter. The distribution system includes five water storage tanks with a total capacity of 4.1 million gallons. There are approximately 1,295 water main operating valves and 1,500 fire hydrants, all of which are operated and flushed annually.

The Village is continually improving and maintaining the water distribution system. These improvements include fire hydrant and valve replacements, residential water meter upgrades and the replacement of aging water mains as the budget allows. The improvements further assure the continued and uninterrupted conveyance of quality drinking water to your tap. Our water system provides an average of 2,193,000 gallons of water daily to our customers.

LAKE MICHIGAN EXPOSURE TO CONTAMINANTS

The IEPA, using the Great Lakes Protocol, completed a source water assessment in April 2003. Lake Michigan is a surface water source and like all surface waters, is susceptible to potential contaminants. The very nature of surface water allows contaminants to migrate to the intake with no protection, only dilution. CLCJAWA's water intake is ranked as moderately sensitive to potential contaminants.

There are no potential contamination sources within the intake's critical assessment zone. However, the combination of land use, storm sewer outfalls and the proximity of North Shore Water Reclamation District (NSWRD) pumping stations in the immediate area add to the susceptibility of CLCJAWA's intake. The NSWRSD discharges their treated waste water to the Des Plaines River and not into Lake Michigan. Access

the following website at <http://www.epa.state.il.us/cgi-bin/wp/swap-fact-sheets.pl> to view a summary of the source water assessment.

We are all participants in the water cycle. Our individual activities impact the rivers and lakes in our watershed and those into which our waste water plants discharge. Please properly use, store and dispose of all medications and household chemicals. Visit the Solid Waste Agency of Lake County website for disposal options and information at www.swalco.org.

REGULATORY AGENCIES

To ensure tap water safety, the U.S. Environmental Protection Agency (USEPA) prescribes limits on the amount of certain contaminants in our drinking water. Water quality may be judged by comparing our water to USEPA benchmarks for water quality. One such benchmark is the Maximum Contaminant Level Goal (MCLG). The MCLG is the level of a contaminant in drinking water below which there is no known or expected risk to health. This goal allows for a margin of safety. Another benchmark is the Maximum Contaminant Level (MCL). An MCL is the highest level of a contaminant that is allowed in drinking water. An MCL is set as close to an MCLG as feasible using the best available treatment technology.

In cooperation with the USEPA the village participated in Unregulated Contaminant Monitoring (UCMR₄) in 2018. No detection was found for any of the contaminants tested. Please contact us for more information on this program.

Water Quality Contaminants Detected in 2018

Contaminant (unit of measure) Typical Source of Contaminant	Highest Level Detected	MCLG	MCL	Range of Detection	Violation	Date of Sample
MICROBIAL CONTAMINANTS						
Total Coliform Bacteria (% Pos/Month) Naturally present; human and animal fecal waste	1	0	5% per month	none	In Compli- ance	Monthly
E. Coli (% Pos/Month) Naturally present; human and animal fecal waste	0	0	0% per month	none	In Compli- ance	Monthly
Turbidity (NTU/Lowest Monthly % < 0.3 NTU) Lake Sediment; soil runoff	100% below 0.3 NTU	none	0.3 NTU	100%	In Compli- ance	Monthly
Turbidity (NTU/Highest Single Measurement) Lake Sediment; soil runoff	0.049	none	1 NTU	0.02 – 0.049	In Compli- ance	1/2018 Monthly
INORGANIC CONTAMINANTS						
Barium (ppm) Discharge of drilling wastes & metal refineries; natural erosion	0.018	2	2	Single Sam- ple	In Compli- ance	11/2018
Copper (ppm) Corrosion of household plumbing systems; natural erosion	0 90 th Percentile	1.3	AL=1.3	0 Sites over AL	In Compli- ance	9/2017
Lead (ppb) Corrosion of household plumbing systems; natural erosion	3.69 90 th Percentile	0	AL=15	0 Sites over AL	In Compli- ance	9/2017
Nitrate as nitrogen (ppm) Runoff from fertilizer; leaching from septic; natural erosion	0.4	10	10	Single Sample	In Compli- ance	11/2018
DISINFECTANT/DISINFECTION BY-PRODUCTS						
HAA5 Haloacetic Acids (ppb) By-product of drinking water disinfection	6	None	60	2.6-8.48	In Compli- ance	2018 Quarterly
TTHMs Total Trihalomethanes (ppb) By-product of drinking water disinfection	15.3	None	80	11.33-33.5	In Compli- ance	2018 Quarterly
Bromate (ppb) By-product of drinking water disinfection	7.30	0	10	0 – 7.30	In Compli- ance	8/2018 Quarterly
Chlorine (ppm) Drinking water disinfectant	0.5	4	4	0.5-0.7	In Compli- ance	Monthly
TOC (Total Organic Carbon)	The % of TOC removal was measured each month & the system met all removal re- quirements set by IEPA					
STATE REGULATED CONTAMINANTS						
Fluoride (ppm) Water additive which promotes strong teeth; natural erosion	0.7	4	4	0.5 – 0.7	In Compli- ance	8/2018 Monthly
Sodium (ppm) Erosion of naturally occurring deposits; water softener	8.0	none	none	Single Sample	In Compli- ance	11/2018
RADIOACTIVE CONTAMINANTS						
Combined Radium 226/228 (pCi/L) Decay of natural and man-made deposits	0.92	0	5	Single Sample	In Compli- ance	4/13/15
Gross Alpha Emitters (pCi/L) Erosion of natural deposits	0.39	0	15	Single Sample	In Compli- ance	4/13/15

The table above lists all of the regulated compounds detected in our water. Bolded compounds were sampled by the Village; all other compounds were sampled by CLCJAWA. The values shown in the Level Detected column are those used by the EPA to determine compliance with drinking water standards. Because each compound is regulated differently, this value may be a running average, a 90th percentile, or the maximum single value. The Sample Date column indicates the date when the sample was collected. When more than one sample is collected, this column shows the date of the maximum value.

Units of Measure:

ppm: Parts per million or milligrams per liter
 ppb: Parts per billion or micrograms per liter
 pCi/L: Picocuries per liter used to measure radioactivity
 NTU: Nephelometric turbidity unit that measures clarity in drinking water.

Definition of Terms:

Action Level (AL): level that triggers special treatment or other required action by water plant.
 Maximum Contaminant Level (MCL): the highest level of contaminant that is allowed in drinking water.
 Maximum Contaminant Level Goal (MCLG): level of a contaminant below which there is no known or expected health risk.
 Treatment Technique (TT): required process used to reduce contaminants in drinking water.

LEAD & DRINKING WATER

Elevated levels of lead can cause serious health problems, especially in pregnant women and young children. Some homes with old lead service lines, lead plumbing, or copper plumbing with lead solder, may have lead and copper in their water. To minimize these levels, the IEPA requires that CLCJAWA add phosphate to our water at a concentration of 0.3 ppm orthophosphate. This commonly used food ingredient coats the inside of your home's plumbing.

Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We cannot control the variety of materials used in plumbing components. You can minimize the potential for lead and copper exposure by flushing your tap for 30 seconds to 2 minutes before using the water for drinking or cooking. To know with certainty whether you have lead or copper in your drinking water, have your water tested at a certified laboratory. Please call CLCJAWA at 847-295-7788 for testing information.

As of January 16, 2017, all schools where kindergarten through 5th graders are present, as well as day care facilities, must test all water sources used for cooking and drinking for the presence of lead. Any facilities constructed after 2000 are not required to complete the testing at this time. Schools should notify parents of the results, if any levels exceed 5 ppb at any location, as well as any actions the schools are taking to reduce the levels.

Water providers are now generating an inventory of all known lead service lines in use and issuing public notification to homeowners of local water main construction or repair work that might increase the risk of lead exposure.

For more information on lead in drinking water, testing methods and steps you can take to minimize exposure, contact the Safe Drinking Water Hotline at 1-800-426-4791 or go to <http://www.epa.gov/safewater/lead>

Some people may be more vulnerable to drinking water contaminants than the general population. Immune compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice from their health care providers about drinking water. The USEPA and Center for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the USEPA Safe Drinking Water Hotline at 1-800-426-4791.

Drinking water, including bottled water, may reasonably be expected to contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects may be obtained by calling the US Environmental Protection Agency's (USEPA) Safe Drinking Water Hotline at 1-800-426-4791.

Both tap and bottled water come from rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of land or through the ground, it dissolves naturally occurring materials and can pick up substances resulting from the presence of animal or human activity. Contaminants that may be present in untreated water include:

- Microbial contaminants such as viruses and bacteria can be naturally occurring or may come from sewage treatment plants, septic systems and livestock operations.
- Inorganic contaminants such as salts and metals can be naturally occurring or result from urban storm water runoff, wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides come from sources such as agricultural and residential storm water runoff.
- Organic chemical contaminants including synthetic and volatile organic compounds are by-products of industrial processes and petroleum production, but can also come from gas stations, urban storm water runoff and septic system.
- Radioactive contaminants can be naturally occurring or be the result of oil, gas and mining activities.
